

Trade Operations RAG Training Manual

Page 1: Trade Lifecycle

An ETD trade moves through execution, validation, matching, clearing, settlement, reporting, and reconciliation.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 2: Trade Capture

Trade capture ensures all execution details are accurately recorded before downstream processing.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 3: Trade Validation

Validation checks account details, instrument identifiers, quantities, prices, and timestamps.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 4: Trade Matching

Matching compares trade details between counterparties to ensure both parties agree.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 5: Clearing

Clearing houses become the central counterparty and reduce settlement risk.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 6: Settlement

Settlement exchanges cash and positions after successful clearing.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 7: Trade Breaks

Trade breaks arise from mismatched data, timing issues, or missing allocations.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 8: Exception Management

Operations analysts investigate and resolve exceptions using internal procedures.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 9: Give-Up Trades

An executing broker transfers a trade to a clearing broker after execution.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 10: Take-Up Trades

The clearing broker accepts responsibility for the transferred trade.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 11: Exchange Operations

Different exchanges have different cut-off times, products, and reporting requirements.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 12: Risk Controls

Operational controls reduce processing errors and regulatory breaches.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 13: Static Data

Correct account, product, and client reference data are essential for STP.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 14: Corporate Actions

Corporate actions can impact positions, settlements, and reconciliations.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 15: Reconciliation

Front-office, exchange, and clearing records are compared to identify breaks.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 16: Margin

Initial and variation margin help manage market risk.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 17: Physical Delivery

Certain contracts require delivery instead of cash settlement.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 18: Regulatory Reporting

Trades must be reported according to jurisdictional requirements.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 19: Operational KPIs

Common KPIs include STP rate, break volume, turnaround time, and settlement efficiency.

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.

Page 20: Knowledge Check

Review the concepts from previous pages. Questions: What is a give-up trade? What causes trade breaks? Why is clearing important?

This page intentionally contains additional descriptive text so that the PDF has enough content for later chunking, embedding generation, semantic search, and citation demonstrations during our RAG project. When we build the retriever, questions related to this topic should retrieve this page or nearby chunks.
